Molecular cloning and expression of cathepsin H, a novel member of the cysteine cathepsins. A genomic clone encoding an active form of cathepsin H was isolated from a cDNA library prepared from thyroid tissue. The gene was isolated by using a

probe which hybridized specifically with a cathepsin H mRNA expressed in the thyroid. The predicted amino acid sequence of the purified protein had a molecular weight of 25,489 Da and a pI of 5.7. The exon-intron structure of the gene was that which has been reported previously for the cathepsin H cDNA sequence. Northern blot analysis indicated that the gene has two transcripts, with sizes of 0.7 and 2.5 kilobases. A comparison of the cDNA sequence with that reported for the previously cloned cathepsin H cDNA sequence revealed several differences, such as an exon 2 sequence. The closest match was between the cathepsin H and the other mammalian cat

Surgical management of orbital blowout fractures: indications and complications. To determine the indications, efficacy, and complications of the surgical management of orbital blowout fractures. Retrospective, noncomparative, interventional case series. All patients with blowout fractures from a 7-year period were included in the analysis. Indications for surgery included

mechanical entrapment and gross and obvious displacement. The most common procedures were: repair of entrapped inferior rectus muscle (32 cases), suturing the fractured orbital floor (26 cases), repair of the orbital floor (15 cases), repair of the fractured medial wall (14 cases), repair of the fractured inferolateral orbital wall (6 cases), and repair of the fractured medial or lateral orbital walls (1 case each). Conversion to a combination procedure to repair the fractured floor. Total (46 cases) or partial (3 cases) enucleation for obvious entrapment. The indications, efficacy, and complications of surgical management. A total of 639 cases of blowout fractures were identified. Of these, 206 (32%) were treated operatively. Of the 226 cases of blowout fracture managed without surgical intervention, 43% spontaneously regressed in size, and 13% resolved without surgery. Of the 206 operative cases, 43 (21%) were converted to a combination procedure due to obvious
