Nova for Windows (Nova for Windows is an application that can track satellites from an unlimited number of observers by presenting the tracking data in text format or colored maps. The user interface is clean, and you should get used to working with this tool pretty quickly. The wizard approach can help you create a database on the go, and you can select the satellites from a preset list (e.g. artificial satellites, celestial objects, amateur, iridium, and others) by dragging and dropping them in a dedicated window. Moreover, it is possible to choose the observers by using the alphabetical keys to jump to a particular selection. You can select the map size (small, medium or large) and type (rectangular, view from space, radar or sky noise map). Nova for Windows lists the satellite position data for one or multiple observers, and you may copy the information to the Clipboard, or print the generated tables. The satellite mutual visibility feature can help you predict when two satellites will be both visible, or within line-of-sight of each other. Furthermore, the app is also able to calculate the time when a satellite passes into the Earth's shadow, and to display a daily summary about the eclipse information, such as sun angle, illumination, time duration, and others. The results may be exported to DOC, XLS, plain text, or copied to the Clipboard. The application is capable of generating different graphs about the potential success for EME between two observers, spatial polarity, angle declination, path degradation, sky temperature of the region beyond the Moon, and the geocentric distance between the Earth and the Moon. You can customize the look of your maps by adjusting the level of brightness and the shading effect for daylight or night time, and by changing the view style. The Internet time synchronization feature will make sure your computer clock displays accurate time values. It is also possible to make this tool play sound notifications when a satellite rises above the horizon, reaches time of closest approach, or sets below the horizon. The built-in satellite editor allows users to add details about the satellite's name, catalog number, inclination, epoch time, and many others. Another important feature that is worth mentioning is the auto tracking option which can be enabled by configuring the dedicated parameters. Overall, Nova for Windows is a reliable application that can help you track satellites from various observers. It

· Track unlimited number of Objects · Track from an unlimited number of observers · Enter into a database, add observers, and keep track of the objects · Choose between 2 modes of display, text or graph · Settings to customize the display · Interactive maps · XML file system · Active power saving mode · Mark the objects under the Moon · Interaction with the social networks (e.g Facebook) · IRIS Lite: Easy access to the community database for IRISSat tracks · Power Save and Wake Up for IRC from IRISSAT or NEOs · Network synchronization: Active power saving mode · Customizable appearance · Automatic Satellite editing: adding more details in the Satellite Editor · Has a built-in editor for you to edit the satellite information manually · Built-in Editor for you to edit the satellite information · Sorting by distance, ascending or descending · Add more observatories: automatic synchronization with your observatory list · Do you need someone to observe your satellite? · Do you need to keep an eye on your satellites? · Do you need to know when to observe? · Do you need to observe from space? · Do you need to observe from a location to which you don't have access? · Can you keep track of the satellites around the Earth? · Can you compare different observatories? · Did you set up automatic tracking? · Can you compare the visibility times between different observers? · Did you enter data about the visibility times? · Can you check the time when the satellite passes to the sun? · Can you check the time when the satellite enters the Earth's shadow? · Can you see the moon during an eclipse? · Can you check the time when the satellite is occulted? · Can you calculate the passing time? · Can you calculate the time when the satellite sets below the horizon? · Can you estimate the period of the satellite? · Can you estimate the time when the satellite is above the horizon? · Can you check the satellite status? · Can you check the points on the map: Magnetic North, Magnetic Variation, Celestial North? · Can you see the Moon on the map? · Can you see the Moon on the map with the zooming? · Can you check the Moon Phases? · Can you check the Moon Phases with the zooming? · Can you 09e8f5149f

Easily and quickly access your contacts by typing names, using the contacts list and autocompletion. Navigate through your contacts list by jumping to the next or previous record by pressing the up or down key. Navigate and select contacts by pressing the left and right keys. Click on a contact name or group of names to open a group of files containing the selected records. For easier typing, an on screen keyboard pops up when contacts are selected. The delete button on a contact record, "X" at the far right corner, will permanently delete that record. Folders. Create, edit, remove and rename the address book subfolders. You can define folder names of your own choice. The Contacts List folders. Contains a list of all groups or contacts, or you can select the "All" folder which will display all contacts. Define the folder path to define the display path. Tabs. Switch between address book folders, groups and contacts. Find/Replace. Search for a contact by searching one or multiple words in the Name field. Replace the searched word with another by pressing the "Replace" button. If you prefer using the Address Book Organizer, the software can also import from the EXCEL, CSV, and MAC ADDRESS BOOK files. Contact information, including email address, phone number, fax number and mailing address, are all imported into the contact lists to help your users contact you. Address Book Organizer. The organizer can import data from the EXCEL, CSV or MAC ADDRESS BOOK files. The contact information including email address, phone number, fax number, mailing address can be imported into the contact lists. Import & Export. Import addresses from Address Book files and export the contacts list or individual contacts to Address Book file. You can use this data to create new contacts from the import data by using the "Create from Table" option in the "File > Import/Export..." menu. Click on the Contact List button at the far right corner, and then select the specific contact list or sub-contact list to be exported to a data file or imported from the data file. The following files are supported: EXCEL, CSV, and MAC ADDRESS BOOK. Automation with Web Service. Use the existing contacts stored in the Address Book database, download contacts from another

What's New In Nova For Windows?

Nova for Windows is an application that can track satellites from an unlimited number of observers by presenting the tracking data in text format or colored maps.
