Key features: The following is a description of the key features of AutoCAD: 1) Image management 2) Security 3) Drawing creation and editing 4) Layouts 5) Views 6) Styles 7) Coordinate systems 8) 3D design 9) Region of interest 1) Image management A) File management B) Virtual image management C) Organizational units D) Image management The first thing you notice when opening a CAD program is the graphics. There are two types of graphics: "virtual" and "actual". A virtual image consists of a two-dimensional window. The graphics in this window are used for viewing the entire design. For example, if a user is viewing a detailed floor plan, he or she would see this virtual image, and the plan would be laid out as a rectangular or circular area, or as blocks of a fixed size. An actual image is a picture. It is often used to show a construction drawing or an engineering drawing. An actual image will be in the center of a virtual image or work area. To open a drawing, you select a file from the Image management. You can also open a drawing by selecting an Organizational Unit or Work Area (e.g., a folder). You can create and modify drawings in three types of files. The file types are: 1) File Path: This file contains the instructions

Allergens and proteins: components of dog and cat dander extracts and complete dander. Epicutaneous reactions with contact allergens are common in the general population and in allergic patients. A number of extracts, prepared from various pet animals have been shown to induce positive skin reactions in the general population and in allergic patients. Most of these extracts contain proteins, although the role of individual protein components in inducing positive reactions has not been determined. Der p 1 and Der f 1, the major allergens from *Dermatophagoides pteronyssinus* and *D. farinae*, respectively, were purified by cation-exchange and affinity chromatography and used to sensitize mice. Adult and young adult and fetal mice were used as skin-test models. Complete dander extracts, prepared by ultrasonic disruption of a house dust mite, were used in guinea pig and human skin-test models. Der f 1, isolated from *D. farinae*, was a more potent sensitizer than Der p 1, isolated from *D. pteronyssinus*. Both proteins were more potent in skin-test models than in guinea pig systems. Dog and cat dander extracts also induced positive skin reactions in adult and young adult and fetal mice and guinea pigs. However, the dose-response curves for complete dander extracts were different from Der f 1 and Der p 1 alone. Both species of dander extract contained proteins similar in size and shape to the major proteins of *D. farinae* and *D. pteronyssinus*. However, the concentrations of these proteins in the dog and cat dander extracts were lower
